NET
WORK

A FIVE-SLIDE EXPLAINER

GENERAL KNOWLEDGE / PLAINDECK DEMO

How the Internet Works

A URL becomes packets, agreements, and finally a page you can use.

CREATED WITH PLAINDECK CLI · EDIT EVERY ELEMENT AS JSON

01

The internet moves packets. The web gives those packets meaning.

Infrastructure carries bytes; protocols agree on addresses, delivery, names, and documents.

Three agreements carry every request

01

NAME
DNS finds an address

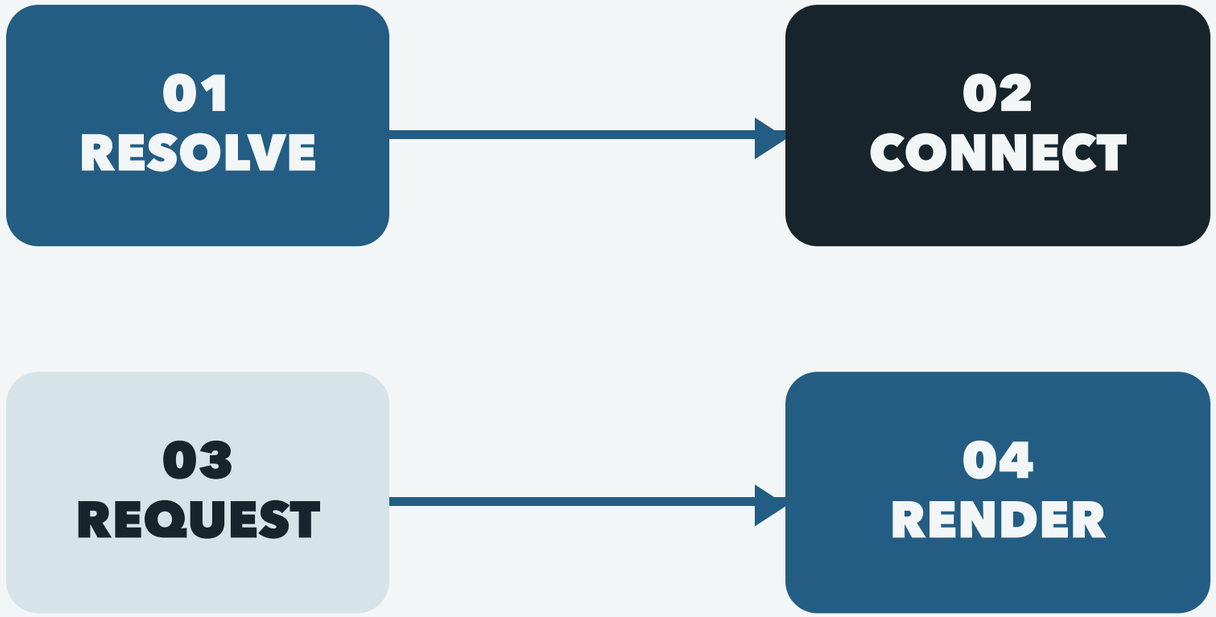

02

ROUTE
IP moves packets

03

DELIVER
TCP or QUIC manages flow

OPEN PROTOCOLS LET DIFFERENT NETWORKS COOPERATE

One URL triggers a chain of agreements

Each layer solves one small problem. Together they turn a human-readable address into a usable page.

The browser repeats this pattern for HTML, styles, scripts, fonts, and images—then combines the results.

4

resolve · connect · request · render

The internet works because every layer has a small, shared contract.

Open standards let billions of devices cooperate without one central machine.
